participants
recruited

December 2021 Update

Thanks to you, RECOVERY has found three effective treatments for COVID-19:

Dexamethasone

An inexpensive steroid

The dexamethasone discovery alone saved an estimated one million lives from COVID-19 worldwide between June 2020 and March 2021

Tocilizumab

A treatment for arthritis

Dexamethasone and tocilizumab cut deaths by up to half for the sickest COVID-19 patients

Ronapreve

Synthetic monoclonal antibody therapy

Ronapreve reduces deaths from COVID-19 for patients who cannot make coronavirus antibodies themselves

The study has also found six treatments that do not work and continues to investigate other potential treatments.

Thank you to everyone involved in RECOVERY. Keep going, you are making a real difference!
